The RMC Research Foundation is proud to announce the release of the Text Reference for Pervious Concrete Contractor Certification. This new text, which will serve as the basis for a formal Pervious Contractor Certification administered by the National Ready Mixed Concrete Association (NRMCA), will increase the knowledge level of contractors in the proper procedures for placing and maintaining pervious concrete pavements. Since no uniform set of guidelines had previously been established for the placement and use of pervious concrete pavements, this new text will help to ensure a baseline of understanding and communication between all involved in the project including the customer, contractor and materials suppliers. The text is now available for sale for a nominal fee from the NRMCA, publication # 2PPCRT.

The use of environmentally-friendly building materials such as pervious concrete pavement is rapidly gaining in popularity among architects, builders, private companies and municipalities all over the country. And, with its designation as a Best Management Practice for stormwater management by the U.S. Environmental Protection Agency, it is no wonder that pervious concrete pavements are leading the way on that front.
